

## 2 types of renewable energy sources

There are two main types of wind turbines available, offshore and onshore. Offshore wind generates more power than onshore options, but is harder to build and therefore upfront costs are a lot higher. Both are therefore important in the power market and providing renewable energy.

Renewable energy is energy that has been derived from earth's natural resources that are not finite or exhaustible, such as wind and sunlight. Renewable energy is an alternative to the traditional energy that relies on fossil fuels, and it tends to be much less harmful to the environment.

Renewable energy sources, such as biomass, the heat in the earth's crust, sunlight, water, and wind, are natural resources that can be converted into several types of clean, usable energy: Bioenergy

Key fact. A renewable energy resource is one that is being (or can be) replenished as it is used. Renewable resources are replenished either by: human action - eg trees cut down for...

In this interactive chart, we see the share of primary energy consumption that came from renewable technologies - the combination of hydropower, solar, wind, geothermal, wave, tidal, and modern biofuels. Traditional biomass - which can be an important energy source in lower-income settings is not included.

Renewable energy (or green energy) is energy from renewable natural resources that are replenished on a human timescale. The most widely used renewable energy types are solar energy, wind power, and hydropower. Bioenergy and geothermal power are also

Types of Renewable Energy Sources Hydropower: For centuries, people have harnessed the energy of river currents, using dams to control water flow. Hydropower is the world's biggest source of renewable energy by far, with China, Brazil, Canada, the U.S., and Russia being the leading hydropower producers.

Renewable energy, usable energy derived from replenishable sources such as the Sun (solar energy), wind (wind power), rivers (hydroelectric power), hot springs (geothermal energy), tides (tidal power), and biomass (biofuels). Several forms have become price competitive with energy derived from fossil fuels.
