Ambri, an American energy storage tech startup founded in 2010, produces liquid metal batteries to store renewable energy from wind and solar power systems for a long time. The company's battery is made from antimony (Sb) and calcium (Ca), and it doesn't need to be cooled or use expensive materials like lithium.

When the battery discharges, the calcium anode releases ions that migrate through the electrolyte to form a calcium-antimony alloy, releasing electrons. During charging, the process reverses.

In addition to pure lead plates, most lead acid batteries use alloys of lead-calcium, lead-tin, lead-tin-calcium, or lead-antimony. The addition of calcium to the plates improves the battery's recharge rate and its resistance to corrosion. The lead-antimony plates have the advantage of prolonging the life of the battery and they are cheaper ...
