

Antimony oxide ore beneficiation has become one of the world's largest mineral processing conundrums. In recent years, many experimental studies dealing with antimony oxide ore have been carried out, resulting in new technical achievements. Much attention has been paid to improving the mineral processing technology of antimony oxide based on such experiments. ...

In case of low-grade ore containing 5 - 25% antimony, the suitable method is oxide volatilization (by roasting and volatilization). For the intermediate grade i.e. 25 - 40% Sb, ores are smelted in a blast furnace at 1300-1400 °C producing pure Sb metal, SO₂ gas, and slag.

For the intermediate grade i.e. 25 - 40% Sb, ores are smelted in a blast furnace at 1300-1400 °C producing pure Sb metal, SO₂ gas, and slag. Finally, in case of the high-grade ores containing 45 - 60% Sb, antimony is extracted by liquation and/or iron precipitation.

This study reports on the assessment of the impact of antimony mine wastes from Xikuangshan (XKS) Antimony Mine in Lengshuijiang City, Hunan Province. We focus on the leaching of a number of potentially toxic elements (PTEs) from residues from the processing of antimony ore. The PTE content of ore processing waste and solutions generated by leaching ...

Antimony has been recovered from its ores or concentrates by pyrometallurgical and hydrometallurgical treatment techniques. Beside these two processes, bio-hydrometallurgical process has been attempted in order to compete or replace the existing processes; however, most of works reported are at the lab scale.

Antimony is a type of critical metal for the energy transition. The antimony industry chain is distributed among the major developed and developing countries around the world. With the development of clean energy technology, the demand for antimony in photovoltaic and energy storage fields will increase significantly.

Antimony is chalcophile, occurring with sulfur and the heavy metals, lead, copper, and silver. Over a hundred minerals of antimony are found in nature. Stibnite (Sb₂S₃) is the predominant ore mineral of antimony. The most important use of antimony metal is as a hardener in lead for storage batteries.

As China curbs exports of the strategic and critical metalloid, America's Last Frontier reemerges as potential domestic supplier. China's coming state-controlled restrictions on antimony exports has significantly elevated the criticality and price of this semi-metal that is already a top concern from many officials within the U.S. Department of Def...

An unsung war hero that saved countless American troops during World War II, an overlooked battery material that has played a pivotal role in storing electricity for more than 100 years, and a major ingredient in futuristic grid-scale energy storage, antimony is among the most important critical metalloids that most people have never heard of.

Here we describe a lithium-antimony-lead liquid metal battery that potentially meets the performance specifications for stationary energy storage applications.

An unsung war hero that saved countless American troops during World War II, an overlooked battery material that has played a pivotal role in storing electricity for more than 100 years, and a major ingredient in futuristic grid-scale energy storage, antimony is among the ...

In Qinglong ore field, the paleo-oil reservoir is found to be associated with antimony deposits, and they have a close genetic relationship. In this study, the aromatics geochemistry of paleo-oil reservoir bitumen was studied to further discuss the thermochemical sulfate reduction (TSR) reaction and the mechanism of antimony mineralization. A total of 124 ...

With regards to the global continuous growth in consumption of base metals such as antimony (Sb), mining companies are currently looking to improve the productivity and extraction of Sb from low grade ore in order to economically process it. With this aim, in this study, an efficient protocol was developed to recover metallic Sb from the low grade $\text{Fe}_3\text{Si}_2\text{O}_5(\text{OH})_4$

Antimony is classified as a critical/strategic metal. Its primary production is predominated by China via pyrometallurgical routes such as volatilization roasting--reduction smelting or direct reduction smelting. The performance of most of the pyro-processes is very sensitive to concentrate type and grade. Therefore, technology selection for a greenfield plant ...
