MIT engineers have created a "supercapacitor" made of ancient, abundant materials, that can store large amounts of energy. Made of just cement, water, and carbon black (which resembles powdered charcoal), the device could form the basis for inexpensive systems that store intermittently renewable energy, such as solar or wind energy.

The supercapacitor will inevitably replace existing storage systems due to the exponential rise in energy consumption and the dearth of renewable energy conversion/storage technologies. Yet, the relative low energy density of superconductors in comparison to batteries is the main barrier to the cutting edge.

In such a case, supercapacitor-battery hybrid energy storage can handle the voltage and frequency stability by supplying the auxiliary power from the battery and transient power from the supercapacitor . In microgrids maintaining a DC bus requires less complexity than maintaining an AC bus because it is efficient and cost-effective.

From the plot in Figure 1, it can be seen that supercapacitor technology can evidently bridge the gap between batteries and capacitors in terms of both power and energy densities. Furthermore, supercapacitors have longer cycle life than batteries because the chemical phase changes in the electrodes of a supercapacitor are much less than that in a battery during continuous ...
