Hybrid energy storage system (HESS) generally comprises of two different energy sources combined with power electronic converters. This article uses a battery super-capacitor based HESS with an adaptive tracking control strategy. The proposed control strategy is to preserve battery life, while operating at transient conditions of the load.

A capacitor is a device used to store electric charge. Capacitors have applications ranging from filtering static out of radio reception to energy storage in heart defibrillators. Typically, commercial capacitors have two conducting parts close to one another, but not touching, such as those in Figure (PageIndex{1}).

Equation 1.9 signify that the current ( $i$ ) passing through a capacitor is a strong function of scan rate ( $\Delta$ ) and more importantly, it is independent of the applied voltage ( $V$ ). Additionally, the plot of the current versus voltage ( $i$  vs.  $V$ ) for various scan rates yields a rectangular shape which is known as a cyclic voltammogram (CV) (Fig. 1.2a).
