Furthermore, there are some material challenges pertaining to the materials of the storage tanks. Storing hydrogen in the liquid form requires a 64% higher amount of energy than that needed for high-pressure hydrogen gas compression, where hydrogen does not liquefy until -253 °C [18], and cooling that far is an energy-intensive process [19].

Recovering compression waste heat using latent thermal energy storage (LTES) is a promising method to enhance the round-trip efficiency of compressed air energy storage (CAES) systems.
