The energy storage capacity of an inductor is influenced by several factors. Primarily, the inductance is directly proportional to the energy stored; a higher inductance means a greater capacity for energy storage. The current is equally significant, with the energy stored increasing with the square of the current.

This expression allows us to calculate just how much of the energy stored by the inductor is stored in the gap, as we'll demonstrate in the following section. turns ratio. Energy storage in a transformer core is an undesired parasitic element. With a high permeability core material, energy storage is minimal. In an inductor, the core provides the flux linkage path between the circuit winding and a non-magnetic gap, physically in series with the core. Virtually all of the energy is stored in the gap.

Energy stored in an inductor. The energy stored in an inductor is due to the magnetic field created by the current flowing through it. As the current through the inductor changes, the magnetic field also changes, and energy is either stored or released. The energy stored in an inductor can be expressed as:  $W = (1/2) * L * I^2$

Toroidal inductors. The prior discussion assumed  $\mu$  filled all space. If  $\mu$  is restricted to the interior of a solenoid,  $L$  is diminished significantly, but coils wound on a high- $\mu$  toroid, a donut-shaped structure as illustrated in Figure 3.2.3(b), yield the full benefit of high values for  $\mu$ . Typical values of  $\mu$  are  $\sim 5000$  to  $180,000$  for iron, and up to  $\sim 10^6$  for special ...

Hello sir, do you think a 100 Henries inductor coil normal? The inductor is a common school use transformer 5000 turn coil, with wire diameter about 0.15mm, the official air-core value is 0.6H, however when I calculate the iron core got a result of 105H. Could this be possible? So it suggests the permeability of the iron core is about 175

Given a current  $I = 12\text{ A}$  and an inductance  $L = 15\text{ H}$ , the energy stored in an inductor is  $E = 0.5 \times L \times I^2 = 1080\text{ J}$ .
