Instead, the battery is charged through regenerative braking and by the gasoline engine. Fuel Cell Electric Vehicles (FCEVs) use hydrogen fuel cells to generate electricity, which powers an electric motor. They emit only water vapor and heat, making them a zero-emission vehicle.

The key reason they can store so much energy is that they use oxygen, drawn from the air, in place of some of the chemical reactants used along with lithium in their lithium ion cousins. The stored power in electric cars, or anywhere on the grid, might not come from batteries after all. There's one big rub: Air isn't just oxygen.

Looking ahead: United Hatzalah has already bought 50 of the foldable electric cars and has agreed to purchase about 1,000 over the next five years. The first cars could hit the streets as soon as 2023 -- and will hopefully be helping volunteers save lives soon after. We'd love to hear from you!

Imagine an electric scooter and look down at the deck. Next, move your eyes across to where the deck connects to the stem. This area of an electric scooter is called the neck, and it's here where the folding can happen. This is often the most compact way to fold an electric scooter as the handlebars lay parallel to the deck.
