Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distributioncenters. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

To reduce dependence on fossil fuels, the AA-CAES system has been proposed [9, 10].This system stores thermal energy generated during the compression process and utilizes it to heat air during expansion process [11].To optimize the utilization of heat produced by compressors, Sammy et al.
