What is Compressed Air Energy Storage (CAES)? Compressed Air Energy Storage is a technology that stores energy by using electricity to compress air and store it in large underground caverns or tanks. When energy is needed, the compressed air is released, expanded, and heated to drive a turbine, which generates electricity.

The innovative application of H-CAES has resulted in several research achievements. Based on the idea of storing compressed air underwater, Laing et al. [32] proposed an underwater compressed air energy storage (UWCAES) system. Wang et al. [33] proposed a pumped hydro compressed air energy storage (PHCAES) system.

The intermittency of renewable energy sources is making increased deployment of storage technology necessary. Technologies are needed with high round-trip efficiency and at low cost to allow renewables to undercut fossil fuels.
