**Compressed air storage** Compressed air can be stored either at constant volume (isochoric) or at constant pressure (isobaric). In case of constant volume storage, the pressure varies and thus indicates the state of charge. The most common example of isochoric storage is a steel pressure vessel or, at large scale, a salt cavern.

CAES systems are categorised into large-scale compressed air energy storage systems and small-scale CAES. The large-scale is capable of producing more than 100MW, while the small-scale only produce less than 10 kW [60].The small-scale produces energy between 10 kW - 100MW [61].Large-scale CAES systems are designed for grid applications during load shifting ...

Compressed air energy storage (CAES) is a way of capturing energy for use at a later time by means of a compressor. The system uses the energy to be stored to drive the compressor. When the energy is needed, the pressurized air is released. That, in a nutshell, is how CAES works. Of course, in reality it is often more complicated.
