Computer Aided Power Systems is a comprehensive book for electrical and electronics engineering undergraduates studying a single semester course on Power Systems. The book introduces students to system behavior through computer calculations, giving students an understanding of power systems from the point of view of the central control facility.

An extension of the concept of classical fault analysis to form "Fault Coefficients" which are used along with Newton Raphson technique, to find current contributions of Voltage Source Converter (VSC) based wind turbines for all types of symmetrical and asymmetrical faults is presented.
