Water enters our van through a locking water hatch. The hatch accepts 1-1/4" or 1-3/8" water fill hoses and has a 1/2" ID port connection for an air vent, which releases pressure in the system as water fills the tanks. Stick your water hose in the hatch and water will flow through the fill hose to the water tank.

Total volume of a cylinder shaped tank is the area, A , of the circular end times the length, l . $A = \pi r^2$ where r is the radius which is equal to $1/2$ the diameter or $d/2$. Therefore: $V(\text{tank}) = \pi r^2 l$ Calculate the filled volume of a horizontal cylinder tank by first finding the area, A , of a circular segment and multiplying it by the length, l .
