Transferring AC/DC electrical power. Electrical distribution systems are an essential part of the electrical power system. In order to transfer electrical power from an alternating current (AC) or a direct current (DC) source to the place where it will be used, some type of distribution network must be utilized.

DC energy can be stored easily in batteries and fuel cells. Such backup batteries can be utilized easily in case of supply failure. Wherever DC power distribution is required, AC power from the transmission network can be rectified at a substation using converting equipment and then fed to the dc distribution system.

A DC distribution system is a power system that utilizes direct current to distribute electricity, resulting in improved efficiency due to fewer power-conversion stages. This system can achieve a larger transmission capacity and is convenient for accessing renewable energy within the same power line corridor.
