

# Describe how a photovoltaic cell works

A photovoltaic (PV) cell is an energy harvesting technology, that converts solar energy into useful electricity through a process called the photovoltaic effect. There are several different types of PV cells which all use semiconductors to interact with incoming photons from the Sun in order to generate an electric current .

PV has made rapid progress in the past 20 years, yielding better efficiency, improved durability, and lower costs. But before we explain how solar cells work, know that solar cells that are strung together make a module, and when modules are connected, they make a solar system, or installation.

When light shines on a photovoltaic (PV) cell - also called a solar cell - that light may be reflected, absorbed, or pass right through the cell. The PV cell is composed of semiconductor material; the "semi" means that it can conduct electricity better than an

Learn how photovoltaic cells work to convert sunlight into electricity in this article. Explore the principles behind p-n junction and the photoelectric effect. What are Photovoltaic Cells? Photovoltaic cells, also known as solar cells, are electronic devices that can

Key takeaways. A photovoltaic cell is the most critical part of a solar panel that allows it to convert sunlight into electricity. The two main types of solar cells are monocrystalline and polycrystalline. The "photovoltaic effect" refers ...

Solar Photovoltaic (PV) cells generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many PV cells within a single solar panel, and the current created by all of the cells together adds up to enough electricity

How do solar cells work? Artwork: How a simple, single-junction solar cell works. A solar cell is a sandwich of n-type silicon (blue) and p-type silicon (red). It generates electricity by using sunlight to make electrons hop across the junction between the different

Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect. Working Principle: The working of solar cells involves light photons creating electron

Solar cell, any device that directly converts the energy of light into electrical energy through the photovoltaic effect. The majority of solar cells are fabricated from silicon--with increasing efficiency and lowering cost as the materials range from amorphous to ...

What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power.
