These inverters also convert DC power to AC power, but use a series of steps to produce a waveform that approximates a sine wave. The resulting output is a rougher, more jagged waveform compared to the smooth curve of a pure sine wave. Main differences between pure sine wave inverter and conventional inverter 1. Waveform Quality

Conventional generators are only going to produce AC (alternating current) electricity. Inverters, on the other hand, produce electricity in three separate phases - high-frequency AC, DC, and then back to a more stable AC current before delivery. Power and fuel efficiency are another major difference between these two backup power sources.
