A utility power transmission and distribution system consists of transmission substations (step-up transformers), transmission lines, distribution substations (step-down transformers), and distribution lines (see Figure 1). Figure 1.

When connected to the electric utility's lower voltage distribution lines, distributed generation can help support delivery of clean, reliable power to additional customers and reduce electricity losses along transmission and distribution lines. In the residential sector, common distributed generation systems include:
Solar photovoltaic panels

Electric Power distribution system components. ... The voltage of large generators in the power system is usually in the range of 13.8 to 24 kV. Large modern generators, however, are built for voltages ranging from 18 to 24 kV. No standard for generator voltages has been adopted.

Electric power distribution is the portion of the power delivery infrastructure that takes the electricity from the highly meshed, high-voltage transmission circuits and delivers it to customers. Some also think of distribution as anything that is radial or anything that is below 35 kV.
