An RB-IGBT stands for Reverse Blocking Insulated Gate Bipolar Transistor. It is a type of power semiconductor device that combines the simple gate-drive characteristics of MOSFETs (Metal-Oxide-Semiconductor Field-Effect Transistors) with the high-current and low-saturation-voltage capability of bipolar transistors. The "reverse blocking" capability means that the RB-IGBT can ...

Brake System: During braking, the mechanical energy generated by wheel motion is converted into electrical energy. Through IGBT-controlled inverter operations, this electrical energy is transferred to energy storage devices, typically batteries. This process stores energy generated during braking, preventing wastage.

At the cut-off time, the electric field does not penetrate the N-drift region, so it is called "non-penetrating" type IGBT. NPT does not need carrier lifetime control, but its disadvantage is that if higher voltage blocking capability is required, it will inevitably require a higher resistivity and thicker N-drift layer, which means that the ...
