This capacity can still offer 18 MWh of electrical load, or enough electricity to power a typical home for more than 15 years. We see three categories of second-life applications: as a spare EV battery, in a stationary energy storage (SES) application, or in a compact mobile storage application (such as a forklift).

Electrochemical Energy Storage: Storage of energy in chemical bonds, typically in batteries and supercapacitors. Thermal Energy Storage: Storage of energy in the form of heat, often using materials like molten salts or phase-change materials. Mechanical Energy Storage: Storage of energy through mechanical means, such as flywheels or compressed air.

The maximal energy-storage density in the nanocomposite with 2.5 vol% BT NF-APS is about 5.6 J/cm<sup>3</sup> at 3300 kV/cm, which is over 220% higher than that of the PVDF at the same electric field. The ...
