Fuses, which were introduced over one hundred years ago, were the first form of protection used on electrical networks. Extremely large numbers of them have been produced since that time and they are still used extensively in the lower voltage sections of power systems around the world.

Protection schemes are specialized control systems that monitor the power system, detecting faults or abnormal conditions and then initiate correct action. In this course the power system is considered as all the plant and equipment necessary to generate, transmit, distribute and utilize the electric power. Types of Faults and Abnormalities Faults

The National Power Grid Electric power is produced by many independent power companies, including invest-owned, cooperative, municipal, and federal agencies. Why to connect the individual companies in a single power network? 1. To ensure the loads can be satisfied. Load varies with weather, time of day, time of year, etc

The death of Professor Arthur Wright in the summer of 1996 deprived me of a friend and a colleague whose judgement and experience shaped this book. I pay tribute to his contributions to protection and electrical engineering education. In the five years since the first edition appeared, many developments have taken place and it is now necessary to update the book.
