In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

Other work has indicated that energy storage technologies with longer storage durations, lower energy storage capacity costs and the ability to decouple power and energy capacity scaling could enable cost-effective electricity system decarbonization with all energy supplied by VRE 8, 9, 10.

The temperature gradient between the HTF and the storage material determines how much energy can be stored. Thermo-chemical thermal energy storage depends on reactants that will undergo an exothermic reaction whereas latent heat involves a phase change where latent heat of fusion of the PCM determines how much energy can be stored or released.

The Degradation Reactions in Electrothermal Energy Storage (DEGREES) Energy Earthshot Research Center advances our fundamental understanding of degradation mechanisms in thermal energy storage materials for grid-scale, long-duration energy storage technologies.
