As shown in Fig. 2 f, the uncycled Si electrode with the CA-PAA binder has a high adhesion strength of 0.8 N, while the adhesion strength of PAA and NaCMC binder is only 0.25 N and 0.1 N, respectively. Corresponding digital photos of Si electrodes after the peel test are shown in Figure S5.

1 Introduction. Dielectric composite materials are usually produced from at least two constituent dielectric materials with notably different functional properties, such as electrical or mechanical properties, wherein one

typical dielectric is chosen as a matrix and a dielectric material is chosen as filler, combining the unique properties of both components. []

The peel test was performed to evaluate the adhesive capacity of the binders. As shown in Fig. 2 f, the uncycled Si electrode with the CA-PAA binder has a high adhesion strength of 0.8 N, while the adhesion strength of PAA and NaCMC binder is only 0.25 N and 0.1 N, respectively.
