O 12, LLZO) are promising electrochemical energy storage systems. However, Li penetration within the solid-state electrolytes (SSEs) due to a large electric field gradient and local electronic conductivity at the crystal grain boundary (GB) causes quick cell failures.

In power systems, high renewable energy penetration generally results in conventional synchronous generators being displaced. Hence, the power system inertia reduces, thus causing a larger frequency deviation when an imbalance between load and generation occurs, and thus potential system instability. The problem associated with this increase in the ...
