A Battery Energy Storage System (BESS) facility is designed to store power from the power grid (charge) when there is an excess of power being produced, and release power back to the power grid (discharge) when there is a shortage of power being produced. BESS facilities do not generate any power, but only store and release

Whether using wind, solar, or another resource, battery storage systems are a very valuable supplement to any diversified energy portfolio for independent power producers (IPPs) selling electricity to utilities, co-ops, and end-consumers.

Not only are lithium-ion batteries widely used for consumer electronics and electric vehicles, but they also account for over 80% of the more than 190 gigawatt-hours (GWh) of battery energy storage deployed globally through 2023. However, energy storage for a 100% renewable grid brings in many new challenges that cannot

be met by existing battery technologies alone.

Electrical Energy Storage (EES) refers to systems that store electricity in a form that can be converted back into electrical energy when needed. 1 Batteries are one of the most common forms of electrical energy storage. The first battery--called Volta's cell--was developed in 1800. 2 The first U.S. large-scale energy storage facility was the Rocky River Pumped Storage plant in ...
