Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

We also consider the impact of a CO₂ tax of up to \$200 per ton. Our analysis of the cost reductions that are necessary to make energy storage economically viable expands upon the work of Braff et al. 20, who examine the combined use of energy storage with wind and solar generation assuming small marginal penetrations of these technologies.
