Among all energy storage systems, the compressed air energy storage (CAES) as mechanical energy storage has shown its unique eligibility in terms of clean storage medium, scalability, high lifetime, long discharge time, low self-discharge, high durability, and relatively low capital cost per unit of stored energy.

Its rating in terms of power is also higher. The only downside of this type of energy storage system is the high capital cost involved with buying and installing the main components. The characteristics exhibited by mechanical energy storage systems makes them ideal for load levelling as well as storage [7].

Mechanical energy storage systems include gravitational energy storage or pumped hydropower storage (PHPS), compressed air energy storage (CAES) and flywheels. The PHPS and CAES technologies can be used for large-scale utility energy storage while flywheels are more suitable for intermediate storage.
