The demand for battery systems will grow as the benefits of using them on utility grid networks is realized. Battery Energy Storage Systems (BESS) can store energy from renewable energy sources until it is actually needed, help aging power distribution systems meet growing demands or improve the power quality of the grid.

Using Lithium-ion battery technology, more than 3.7MWh energy can be stored in a 20 feet container. The storage capacity of the overall BESS can vary depending on the number of cells in a module connected in series, the number of modules in a rack connected in parallel and the number of racks connected in series.

Now that we have a simple grid-tied system, let's build onto it by adding energy storage. The 2017 Article 706.2 of the National Electrical Code (NEC) defines an energy storage system as: "One or more components assembled together capable of storing energy for use at a future time. ESS(s) can include but is not limited to batteries, capacitors, and kinetic energy ...

Currently, a battery energy storage system (BESS) plays an important role in residential, commercial and industrial, grid energy storage and management. BESS has various high-voltage system structures. Commercial, industrial, and grid BESS contain several racks that each contain packs in a stack. A residential BESS contains one rack.
