Fuel cells (FCs) emerge as a promising technology for hybrid electric vehicles (HEVs), offering a compelling alternative to conventional vehicles and even challenging pure electric cars, which are often limited by driving range and lengthy charging times, as shown by Jensen Hans-Christian B. et al. [28] and Lachhab Islem and Lotfi Krichen [38].FCs leverage ...

Pure battery electric vehicles, gasoline hybrid electric vehicles, and fuel cell electric vehicles (FCEVs) are the main "green" vehicles. Pure battery electric vehicles have a typical driving range of less than 400 km per charge and the recharging time is as long as 1-3 h currently [4], although continuous improvements are being made by manufacturers such as Tesla.

Hydrogen is considered an alternative fuel under the Energy Policy Act of 1992 and qualifies for alternative fuel vehicle tax credits. ... FCEVs use a propulsion system similar to that of electric vehicles, where energy stored as hydrogen is converted to electricity by the fuel cell. ... FCEVs are fueled with pure hydrogen gas stored in a tank ...

Energy storage for pure fuel vehicles

Electric vehicles, especially pure electric vehicles, have been considered as one of the most ideal traffic tools for green transportation system development with perfect emission performance [1], [2]. As the only energy storage units, the performance of batteries will directly influence the dynamic and economic performance of pure electric vehicles.

Recent years have seen significant growth of electric vehicles and extensive development of energy storage technologies. This Review evaluates the potential of a series of promising batteries and ...

Sustainable vehicles represent crucial alternatives to traditional combustion engines. This study comprehensively compares four prominent sustainable vehicle technologies: biofuel-powered vehicles (BPVs), fuel cell ...

Some studies analyzed all the commercial energy vehicles such as hybrid EVs, pure EVs and fuel cell vehicles with a focus on pure EVs (Frieske et al., 2013, Zhang et al., 2017). More than 350 EVs were manufactured by different enterprises in the automotive industry between the years 2002-2012. ... The theoretical energy storage capacity of Zn ...

As the most prominent combinations of energy storage systems in the evaluated vehicles are batteries, capacitors, and fuel cells, these technologies are investigated in more ...

Among these, hydrogen-based fuel cell technology for EVs has demonstrated high potential in storing and converting chemical energy into electricity, offering advantages such as high ...

SOURCE: Mattuci (2015). several types of fuel cells, the proton exchange membrane (PEM)--also sometimes called a polymer electrolyte membrane--is the fuel cell technology of choice for transportation applications ...

This paper provides an in-depth review of the current state and future potential of hydrogen fuel cell vehicles (HFCVs). The urgency for more eco-friendly and efficient alternatives to fossil-fuel-powered vehicles underlines the necessity of HFCVs, which utilize hydrogen gas to power an onboard electric motor, producing only water vapor and heat. ...

LBG enables more fuel storage capacity in vehicles due to its liquid state, resulting in a higher energy density compared to CBG. ... water, and oxygen from the air. Pure hydrogen is usually fed into the cells via reformers or storage tanks. Lower operating temperatures, about 80 °C (176 °F), provide faster startup times and increased ...

When compared to vehicles that use a single power source, hybridization of energy sources has provided a cost reduction and increase in fuel economy (Song et al., 2018a, Nassif and Almeida, 2020). When three hybrid power sources are used to power the vehicle, a control, and management mechanism known as a power/energy

This paper proposes a framework of strategic energy management for fuel cell electric vehicles (FCEVs), which is developed to safeguard the dual vehicle energy sources, that is, fuel cells and power batteries. This is accomplished by applying an energy management strategy (EMS) from a prognostic perspective.

Electric vehicles (EVs) are becoming popular and are gaining more focus and awareness due to several factors, namely the decreasing prices and higher environmental awareness. EVs are classified into several categories in terms of energy production and storage. The standard EV technologies that have been developed and tested and are commercially ...

The following energy storage systems are used in all-electric vehicles, PHEVs, and HEVs. Lithium-Ion Batteries. Lithium-ion batteries are currently used in most portable consumer electronics such as cell phones and laptops because of their high energy per unit mass and volume relative to other electrical energy storage systems.

Nowadays, we face a series of global challenges, including the growing depletion of fossil energy, environmental pollution, and global warming. The replacement of coal, petroleum, and natural gas by secondary energy resources is vital for sustainable development. Hydrogen (H₂) energy is considered the ultimate energy in the 21st century because of its diverse sources, cleanliness, ...
