The Goldendale Energy Storage Project has a head of 2,400 feet and is expected to cost \$1,800/kW for C& I. Higher head for the project also reduced tunnel excavation costs due to the fact the pump/turbine centerline depth below the lower reservoir bottom decreased with increasing head (Miller, 2020a).

Therefore, efforts to reduce cost of storage via engineering design are expected to gain traction. As long-duration energy storage (diurnal and seasonal) becomes more relevant, it is important to quantify cost for incremental storage in the cavern. The incremental cost for CAES storage is estimated to be \$0.12/kWh.

Using the detailed NREL cost models for LIB, we develop base year costs for a 60-MW BESS with storage durations of 2, 4, 6, 8, and 10 hours, shown in terms of energy capacity (\$/kWh) and power capacity (\$/kW) in Figure 1 and Figure 2 respectively.

Base year costs for utility-scale battery energy storage systems (BESS) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2021). The bottom-up BESS model accounts for major components, including the LIB pack, inverter, and the balance of system (BOS) needed for the installation.

Total installed grid-scale battery storage capacity stood at close to 28 GW at the end of 2022, most of which was added over the course of the previous 6 years. Compared with 2021, installations rose by more than 75% in 2022, as around 11 GW of storage capacity was added.

One of the most critical aspects of installation costs is the scale of the energy storage system. Larger systems often benefit from economies of scale, enabling users to achieve a lower cost per unit of energy stored.

BESS provides businesses with a higher degree of energy price security and independence. In an era of increasing energy price volatility and potential grid instability, having a dedicated energy storage system means businesses can maintain operations during price spikes or grid failures. This is particularly crucial for industries where ...

This inverse behavior is observed for all energy storage technologies and highlights the importance of distinguishing the two types of battery capacity when discussing the cost of energy storage. Figure 1. 2021 U.S. utility-scale LIB storage costs for durations of 2-10 hours (60 MW DC) in \$/kWh. EPC: engineering, procurement, and construction
