If a fault condition occurs that prevents an instruction from running, the instruction aborts and the controller reports a major fault. A major fault halts logic execution and the controller switches to faulted mode (the OK LED flashes red). Depending on the application, you may not want all major faults to shut down the system.

There are multiple reasons why you are getting this fault. There are Technotes in the knowledge base that may apply to your specific issue. However, most of them have "Techconnect" access level and can"t be posted here. If you.have Techconnect then search for "Energy Storage Fault"

Abstract: Compressed-air energy storage (CAES) is considered a promising energy storage system for many grid applications, including managing renewable variability and grid capacity concerns. However, compared with conventional generation such as coal or hydro, the cost of storage power of CAES is still high, which impedes its deployment.
