What Is Peak Shaving? Also referred to as load shedding, peak shaving is a strategy for avoiding peak demand charges on the electrical grid by quickly reducing power consumption during intervals of high demand. Peak shaving can be accomplished by either switching off equipment or by utilizing energy storage such as on-site battery storage systems.

However, when the TPGs conduct conventional peak load regulation, the 300-MW units are the main subjects in the peak load regulation to match the fluctuation of the wind power output. The 250-MW and 150-MW

units conduct the peak load regulation according to the minimum allowable output, and only increase the output during the valley periods.
