This ensures more electrical energy is used for its intended purpose rather than wasted. Copper vs. Aluminum Bus Bars. Aside from copper, aluminum is a common material used for bus bars. While aluminum is lighter and often more cost-effective, it exhibits higher series resistance and lower electrical conductivity compared to copper.

(as well as aluminum lugs). The lugs are aluminum for a very good reason - due to thermal expansion differences, this plays to aluminum's advantage, making it the "universal donor". Copper lugs play badly with aluminum wire (hence the famous trouble with That 70's small branch circuit wiring). However the bus bars can go either way.
