Due to the important status of energy conversion facilities in the station, a reasonable operation strategy of CHP ...

What is thermal energy storage? Thermal energy storage means heating or cooling a medium to use the energy when needed later. In its simplest form, this could mean using a water tank for heat storage, where the water is heated at times when there is a lot of energy, and the energy is then stored in the water for use when energy is less plentiful.

For a higher-grade thermal energy storage system, the heat of compression is maintained after every compression, and this is denoted between point 3-4, 5-6 and 7-8. The main exergy storage system is the high-grade thermal energy storage. The reset of the air is kept in the low-grade thermal energy storage, which is between points 8 and 9.

During the energy storage and release process, energy conversion losses in storage stations are primarily released as heat into the surrounding environment. As the scale of such storage stations continues to expand, especially in densely concentrated layouts, the massive energy conversion process releases heat like a tide.

Thermal energy storage (TES) is the storage of thermal energy for later reuse. Employing widely different technologies, it allows surplus thermal energy to be stored for hours, days, or months. Scale both of storage and use vary from small to large - from individual processes to district, town, or region.
