In the former case, the hydrogen is stored by altering its physical state, namely increasing the pressure (compressed gaseous hydrogen storage, CGH₂) or decreasing the temperature below its evaporation temperature (liquid hydrogen storage, LH₂) or using both methods (cryo-compressed hydrogen storage, CcH₂).

The incredible energy storage capacity of hydrogen has been demonstrated by calculations, which reveal that 1 kilogram of hydrogen contains around 120 MJ (=33.33 kW h) of energy, more than twice as much as most conventional fuels. The energy contents of hydrogen and other alternative fuels are contrasted in Table 1. 6-8.

In this modeling study, the large storage tank at the hydrogen filling station is assumed to have an initial
