This captured thermal energy is used to generate electricity via a typical Rankine steam turbine, where excess energy can also be stored in a Thermal Energy Storage (TES) system. The majority of commercial CSP plants [1] utilize a sensible heat TES system that uses a two-tank system and "solar salt" as the storage medium.

A major challenge is that the availability of this thermal energy may not be synchronized with its demand. Fortunately, thermal energy storage (TES) systems can be used to temporally decouple recovery of this waste heat from its utilization.
