The single-step static collaborative planning scheme of transmission network and energy storage will result in "over-investment" of transmission lines and energy storage, that is, the amount of transmission line expansion and energy storage configuration far exceeds the transmission capacity demand corresponding to the current load.

Energy storage is placed along a transmission line and operated to inject or absorb real and reactive power, mimicking transmission line flows. Storage deployed in this manner can essentially take the place of a proposed line upgrade or new line that would otherwise be built (see Figure 1). Using energy storage for transmission capacity is a new
