The kinetic energy stored in the flywheel is presented in Eq. (1). $E = \frac{1}{2} J \omega^2$ where E is the stored energy, J is the moment of inertia, ω is the rotational speed. The speed of the flywheel undergoes the state of charge, increasing during the energy storage stored and decreasing when discharges.

The minimum speed of the flywheel is typically half its full speed, the storage energy is be given by $E = \frac{1}{2} J \omega^2$ where J is the rotor moment of inertia in kgm^2 and the ω maximum rotational speed in rad/s . The power level is controlled by the size of the M/G, so this is independent of the rotor.
