

Flywheel energy storage starts the generator

When energy is required, the motor functions as a generator, because the flywheel transfers rotational energy to it. This is converted back into electrical energy, thus completing the cycle. As the flywheel spins faster, it experiences greater force and thus stores more energy.

The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm^2], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...
