"The investment cost share of the storage tanks increases only by 3% from a daily to a weekly storage cycle, which corresponds to an increase in the levelized cost of merely 0.01 \$/kWh." The ammonia-based energy storage system demonstrates a new opportunity for integrating energy storage within wind or solar farms.

Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C.
