The steering motor itself is typically a DC, reversible motor that provides assist through a worm gear and reduction gear. The PSCM combines inputs such as steering shaft torque sensor, vehicle speed (via serial data), calculated system temperature, and steering tuning setting to determine the amount of assist required -- for example, greater assist would be ...

Because dynamometer range tests--accelerating, coasting, and braking to follow a precise trace on a computer screen from 100 percent to zero state of charge--were long, tedious, and boring, Garrett...

The Electronic Variable Orifice Steering System (EVO) was first introduced by General Motors. To properly function, this system required proper operation of the EVO solenoid (see below), control module and vehicle speed sensor. A malfunction in the EVO solenoid can result in loss of regulated assist or even complete loss of power assist.

Forced oscillation is a phenomenon where the power swing is caused by an external periodic input, e.g., an oscillating steam valve in a turbine generator. The phenomenon has been known for years; however, only become more visible recently, thanks to the installation of Phasor Measurement Units (PMUs). This technical report is driven by the forced oscillation ...
