In a switch optimization problem for a distribution feeder with "n" number of SS with "r" number of automated switch placements, the total number of possible combinations for which the CIC is calculated is given by Eq. ()CIC needs to be calculated for all possible combinations of switch placements to arrive at a global optimal solution. In the proposed ...

The electric power system has three main components; generation, transmission and distribution. Among these three components, the distribution system is the most critical and important component in terms of its impact on reliability and quality of supplied electricity and also cost of electricity [1], [2], [3], [4].

Of the "big three" components of electrical infrastructure, distribution typically gets the least attention. In fact, a thorough, up-to-date treatment of the subject hasn"t been published in years, yet deregulation and technical changes have increased the need for better information. Filling this void, the Electric Power Distribution Handbook delivers comprehensive, cutting ...

Volt/Var control is one of the most important functions in the operation of distribution systems. According to [], a proper selection and coordination of equipment for controlling voltage and reactive power are major challenges faced by power system engineering. 2.1 Reliability in Distribution Networks. One of the earliest references in the reliability concept for DNs is presented by L.B Crann in [], where the key role of the sectionalizing switches in DNs towards reliability improvement is explained for the first time. Moreover, reliability is directly related to the average time for which a consumer experiences an outage.

In the case (a) we can draw aline between point (x1,y1) and the point (x2,y2) but there are some parts of the function which are above the line segment (i.e the function is non-convex). In the case (b) we can see that everypoint in the line segment is below the function ...
