Most high-voltage ESS consist of multiple battery modules (BMUs) to manage and scale a system for site-specific requirements. Within a BMU, MPS's battery monitoring and protection devices can be used as a comprehensive analog front-end (AFE) to accurately measure up to 16 series Li-ion battery cells.

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the voltages supported and the power flowing.

In an electric car, the high-voltage box is the highly integrated battery charger and power supply control center. It charges the vehicle battery at an AC charging point, such as public and private charging stations.
