

RMS value of the voltage (kV) or current (kA) Peak value of the voltage or current: highest instantaneous value. For an AC voltage or current, the peak value is $\sqrt{2}$ times the rms value. The voltage mentioned is the voltage U which is common between the phases of a balanced network. The voltage between phase and neutral is deduced from this by $V \dots$

The so-called energy storage means that when the circuit breaker is de-energized (that is, when it is opened), it opens quickly due to the spring force of the energy storage switch. Of course, the faster the circuit breaker is opened, the better.
