In an era characterized by increasing energy demand and a growing emphasis on sustainability, energy storage systems have emerged as a pivotal solution to bridge the gap between energy production and consumption. As the global energy landscape undergoes a profound transformation, the importance of these systems cannot be overstated.

Since discharging fumes out the stack at a high velocity, these systems tend to consume large amounts of energy. This can be minimized through an energy efficient, optimized stack discharge. There are multiple ways to design an optimized stack discharge system. Each of the following will need to balance energy efficiency with optimal performance.

Storage. Batteries allow for the storage of solar photovoltaic energy, so we can use it to power our homes at night or when weather elements keep sunlight from reaching PV panels. Not only can they be used in homes, but batteries are playing an increasingly important role for utilities.

Block stacking puts unit loads on top of each other and places them on the floor in storage lanes. Block stacking is good for plants with low ceilings, many SKUs, full load puts and picks, and when FIFO is not an operational requirement. Stack height, load width and depth, and aisle allowances should be defined. More info
