One of the most important factors in selecting the right hot water tank for your application is the tank's storage capacity. Sizing depends on the hot water demand and the general heating capacity of the system. If the system's heating capacity is low, then it may be a good idea to buy a larger storage tank.

A tankless water heater, sometimes called an on-demand or instantaneous water heater, doesn't use a storage tank and heats water only when it is needed, providing a continuous supply of hot water ...

Picking the best water heater depends on your hot water usage, existing installation requirements, and budget. A 40-gallon water heater is typically the right size for a household of two or three people. Keep in mind that you can't use the storage tank capacity as the only determining factor.

Some storage water heater models have heavily insulated tank, which significantly reduce standby heat losses and lower annual operating costs. Look for models with tanks that have a thermal resistance (R-Value) of R-24 and above to avoid adding an insulation blanket (electric water heaters only).

A single-family storage water heater offers a ready reservoir -- from 20 to 80 gallons -- of hot water. It operates by releasing hot water from the top of the tank when you turn on the hot water tap. To replace that hot water, cold water enters the bottom of the tank through the dip tube where it is heated, ensuring that the tank is always full.

Pipe insulation is inexpensive and easy to install. Add it to hot and cold water pipes in unconditioned spaces such as garages, attics, and crawlspaces and for a distance of at least six feet from the tank. Heat traps prevent heated water in a storage tank from mixing with cooled water in pipes, a process called thermosiphoning.

Controller system. Most solar hot water systems have a controller system that ensures the water in the storage tank doesn't get too hot. Controller systems can also prevent cold water from being cycled through the system when it's extremely cold outside and the transfer fluid isn't sufficiently warmed. Backup heater

1. Open vented hot water systems This system uses many different parts to heat the water. It consists of a hot water cylinder, a cold water storage cistern (tank), special pipework (known as an open vent pipe), and a heat source to heat the water. There are two types of open vented hot water; direct heating and indirect heating.
