Dragonfly Energy has advanced the outlook of North American lithium battery manufacturing and shaped the future of clean, safe, reliable energy storage. Our domestically designed and assembled LiFePO₄ battery packs go beyond long-lasting power and durability--they're built with a commitment to innovation in our American battery factory.

Most battery-powered devices, from smartphones and tablets to electric vehicles and energy storage systems, rely on lithium-ion battery technology. Because lithium-ion batteries are able to store a significant amount of energy in such a small package, charge quickly and last long, they became the battery of choice for new devices.

Alsym Green is an inherently non-flammable, non-toxic, non-lithium battery chemistry. It uses a water-based electrolyte and is incapable of thermal runaway, making it the only option truly suitable for urban areas, home storage, data centers, and hazardous environments such as chemical plants, oil and gas facilities, and steel mills.

Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

Lithium batteries are becoming increasingly important in the electrical energy storage industry as a result of their high specific energy and energy density. The literature provides a comprehensive summary of the major

Li-ion batteries have a typical deep cycle life of about 3000 times, which translates into an LCC of more than \$0.20 kWh⁻¹, much higher than the renewable electricity cost (Fig. 4 a). The DOE target for energy storage is less than \$0.05 kWh⁻¹, 3-5 times lower than today's state-of-the-art technology.

Energy storage systems allow energy consumption to be separated in time from the production of energy, whether it be electrical or thermal energy. The storing of electricity typically occurs in chemical (e.g., lead acid batteries or lithium-ion batteries, to name just two of the best known) or mechanical means (e.g., pumped hydro storage).
