

How solar inverter works

Although many inverters work as standalone units, with battery storage, that are totally independent from the grid, others (known as utility-interactive inverters or grid-tied inverters) are specifically designed to be connected to the grid all the time; typically they're used to send electricity from something like a solar panel back to the ...

Houses are wired to operate on alternating current (AC) power. Every photovoltaic solar energy system for use with household electricity requires a way to transform the direct current (DC) energy created by the solar panels to AC power. The power inverter your home's solar energy array requires will depend on several factors.

The higher the energy loss, the lower the efficiency rating. Look for solar inverters with high efficiency ratings between 96% and 99%. Depending on the type, solar inverters will match either your system size or your panel size. The string inverters' maximum output capacity should match your system size.

However, the normal inverter works one way-- DC to AC. You must deploy another inverter to bring the energy back to DC for battery storage. It can be a complex and tricky deal for the solar system as a whole. Hybrid Inverters are the perfect solution in this case. They work both ways-- AC to DC and back to AC.
