Battery energy storage systems (BESS) are charged and discharged with electricity from the grid. Lithium-ion batteries are the dominant form of energy storage today because they hold a charge longer than other types of batteries, are less expensive, and have a smaller footprint. Batteries do not generate power; batteries store power.

In order to improve the power system reliability and to reduce the wind power fluctuation, Yang et al. designed a fuzzy control strategy to control the energy storage charging and discharging, and keep the state of charge (SOC) of the battery energy storage system within the ideal range, from 10% to 90% [44]. When the SOC is close to its limits ...
