disturbances. These changes in energy are referred to as head gains and head losses, respectively. Because energy is conserved, the energy across any two points in the system must balance. This concept is demonstrated by the energy equation:
$$g \frac{V}{g} + \frac{G}{g} + \frac{H_L}{g} + \frac{V}{g} + \frac{z}{g} + \frac{p}{g} + \frac{H}{g} + \frac{V}{g} + \frac{z}{g} + \frac{p}{g} + \dots = \dots + \frac{2}{2} + \frac{2}{2} + \frac{2}{2} + \frac{2}{2} + \frac{1}{1} + \frac{1}{1} + \frac{1}{1}$$
 where p = pressure (N/m², lb/ft²)

During the buffer stroke, part of the energy absorbed by the buffer is dissipated to the environment as heat energy, the actual amount of energy dissipated is a function of the buffer system. This part of the absorbed energy is the so called damping part.

Thermal Energy Storage and Buffer Tanks for Cooling. Thermal energy storage (TES) is a method used to manage peaks in district heating and cooling systems. In summary, a hydraulic accumulator tank is a crucial component in hydraulic systems, acting as a storage device for hydraulic fluid and providing a buffer of energy that can be released when needed. It helps to maintain system stability, reduce wear on components, and ensure efficient operation of the hydraulic system.

The BuffMax from Thermo 2000 is a 3-in-1 solution that acts as a buffer tank, storage tank and hydraulic separator is recommended to optimize the performance of several different types of heating systems: low-mass boilers, biomass systems, geothermal and heat pump applications, multi-zone systems, and solar energy systems. The BuffMax is synonymous with versatility.
