3. INTRODUCTION A Hydraulic Accumulator is energy storage device. It is pressure storage reservoir in which a non- compressible hydraulic fluid is held under pressure by an external source. The external source used can be a spring, a raised weight, or a compressed gas. The main reasons that an accumulator is used in a hydraulic system, is that the pump ...

When the hydraulic press does not need a large amount of high-pressure liquid, such as during return or stop, the high-pressure liquid supplied by the pump can be partially or completely stored in the accumulator, and when the hydraulic press needs a large amount of high-pressure liquid, it is supplied by both the pump and the accumulator.

The driving system of hydraulic press mainly consists of two types: pump direct drive and pump-accumulator drive. Pump Direct Drive: In this system, the pump provides high-pressure working fluid to the hydraulic cylinder, and a distribution valve is used to change the direction of the supply liquid.
